

Coinnect Lean Canvas

SmartTech | Proposed UM Tagum campus pilot | Partial physical prototype

Working business hypotheses. Demand, pricing, and competitive advantages require validation.

Problem Cash denominations may not match small payment needs. Cash holders may need wallet funds, or wallet users may need cash. Alternatives to validate: cashiers, acquaintances, and available service outlets. Frequency and inconvenience are unmeasured.	Solution One touchscreen kiosk for PHP bill and coin conversion. Wallet access after integration and operating readiness. Transaction records and a claim process for unresolved payouts. Key Metrics Completed and repeat transactions. Completion time and inventory shortages. Support requests and unresolved claims. Fee contribution and user-reported time or cost change.	Unique Value Proposition Convenient campus access to suitable cash denominations and wallet services through one kiosk. Cash conversion designed for offline operation. Hypothesis: proximity and combined services justify a transparent fee. Test against existing alternatives.	Unfair Advantage No proven unfair advantage yet. Potential advantage to build: reliable campus operations, user insight, and maintainable integrated hardware. These are not exclusive assets. Channels Subject to permission: campus demonstrations, student groups, and orientation activities. On-site signage and referrals. Merchant interviews to learn demand.	Customer Segments Initial users and fee customers: UM Tagum students and staff with recurring cash or wallet needs. Early adopters: users who report repeated inconvenience and accept a fee. Proposed host: campus administration. Secondary beneficiaries: nearby merchants.
Cost Structure Hardware, enclosure, assembly, and validation; maintenance, parts, paper, connectivity, power, host costs, cash servicing, and support. Cash float and any settlement funding are separate liquidity requirements. Finished kiosk cost remains unverified.		Revenue Streams Proposed service fees on completed cash-conversion and enabled wallet transactions. Fee levels and willingness to pay are unvalidated. Fee revenue less provider and direct costs gives contribution. Deduct recurring costs to estimate operating surplus. Transaction principal is not revenue.
